

MARYLAND DEPARTMENT OF THE ENVIRONMENT

Lead Poisoning Prevention Program

Childhood Blood Lead Surveillance in Maryland

Annual Report 2012

Number and percentage of children 0-72 months old tested for lead (2003-2012), with number and percentage of those with Elevated Blood Lead (EBL), or Lead Poisoning (2003-2004), with Prevalence and Incidence Cases (2005-2011), and with number and percentage of BLL 5-9 and BLL ≥ 10 $\mu\text{g/dL}$ (2012) by county of residence

Supplementary Data Tables: Supplement # 4

July, 2013

Terms and definitions

1. Population of children for 2003 is adapted from the US Census Bureau five-year age-sex-county specific population estimate for 2003. The 2004-2010 populations are adapted from US Census Bureau: "State Interim Population Projection by Age and Sex: 2000-2030". Population for 2011 and 2012 were adapted from Maryland census population 2010, provided by the Maryland Data Center, Maryland Department of Planning, www.planning.maryland.gov/msdc.
2. Elevated Blood Lead level (EBL) is defined as a venous or a capillary blood lead level ≥ 10 $\mu\text{g/dL}$
3. Lead Poisoning is defined as a venous blood lead level ≥ 20 $\mu\text{g/dL}$.
4. From 2005 forward the term "Prevalence" is introduced based on number of children with blood lead level ≥ 10 $\mu\text{g/dL}$ who may have one or more EBL in the past, and term "Incidence" is introduced based on number of children with the very first EBL in that calendar year.
5. County assignment for 2003 was based on child's address census tract as the first order of priority followed by child's address zip code, and the provider's address zip code as the last. From 2004 forward county assignment is based on child's address census tract or the zip code. Reports with no or incomplete address were assumed to be from Maryland children with county unknown.
6. In March 2012, based on recommendation of the Advisory Committee on Childhood Lead Poisoning Prevention, CDC dropped the concept of blood lead level of 10 $\mu\text{g/dL}$ as "Level of Concern" and adopted the blood lead level of 5 $\mu\text{g/dL}$ as "Reference Value". To accommodate these revisions, this supplementary data table was revised accordingly. For calendar year 2012, the prevalent and incident columns of cases of BLL ≥ 10 $\mu\text{g/dL}$ were collapsed into one columns (Blood Lead Level ≥ 10), and new column "Blood Lead Level 5-9" was added. Be advised the numbers are based on number of children tested. For children with multiple tests in a calendar year the highest venous blood lead test or the highest capillary in the absence of any venous test was selected. As such a child who is counted under "Blood Lead Level ≥ 10 " has not been counted under "Blood Lead Level 5-9" even if the child had any blood lead test in that category. Further revisions on the content and format of this supplementary will be implemented if it deems necessary.
